

# VIROthatch

100% recyclable synthetic thatch

## Why is Virothatch better than natural thatching and other synthetic thatch products?

**Virofiber introduces Viro thatch, the synthetic, fire resistant, pest free, 100% recyclable alternative to natural thatch.**

Three years in the making, Virofiber, the leading maker of environmentally friendly all-weather wicker, has launched an innovative synthetic thatch solution that's 100% recyclable and pest free.

Virothatch uses a reproduction process that replicates Balinese thatch-work artistry.

The thatch is woven like traditional thatch-work making it beautifully finished both inside and out. Virothatch is available in two styles, Bali (smooth) and Java (textured).

These styles give finished structures an authentic seam-less thatched look that is the most natural looking in the market today. And since it's made of Virofiber, its performance is guaranteed for years.

Maintenance free. Will not mold, rot, decay or shed.

Resists termites, birds and other pests that would normally infest and breakdown natural thatching.

Installation costs are low, since no specialized craftsmen are necessary for installation.

Low wind load rating makes Virothatch safer than natural thatch because it's breathable and flexible in high winds.

Virothatch is 100% waterproof. Since it does not absorb water, it will not add extra stress on the roof during high rains.

Available with built-in fire retardant up on request

Virothatch is available in two textures. Bali [smooth] and Java [textured].

No seasonal shortages since Virothatch is factory produced.

100% recyclable since it's made of only HDPE, high-density polyethylene.

Virothatch panels are available in 31" (78.7 cm).

Each strand varies from rown to honey, giving an authentic natural thatch coloration.

Bali [smooth].

Java [textured].
